The Hardware/Software Architecture is a complete Embedded System (ES).

Hardware side includes processor, buses, memory and peripherals like co-processors, sensors, robotic arm, controllers, UARTs, etc., Software side includes a Linux OS with a set of libraries that performs different functionalities and to control all components in FPGA, these functions are easy-understanding for robotic programmers.

embedded system but works as a single system for a single goal. Software architecture plays a vital role for the control system of hardware. It uses interdependent layered architecture for the control structure of the robot. The software layers are built on top of "physical layer", which consists of actual sensors and robots.

(SLAM) problem applied to embedded robots. The architecture is composed by highly specialized modules for robot localization and feature-based map building from images obtained directly from CMOS cameras in real time. The system is completely embedded on a Field-Programmable Gate Array (FPGA) device, where several hardware-orientated optimizations are exploited.

An embedded gadget can be the notion of as a laptop hardware device having software program embedded in it. An embedded gadget may be an impartial system or it may be part of a huge system. An embedded system is a microcontroller or microprocessor primarily based gadget that's designed to perform a particular task.
