"Seating and Wheeled Mobility: A Clinical Resource Guide presents clinical assessment considerations when working with a person with a disability who may need wheelchair seating for postural support, skin integrity, or a wheelchair base to best meet dependent or independent mobility needs. Michelle L. Lange and Jean L. Minkel have designed this text to support occupational and physical therapists, complex rehabilitation technology suppliers, and even third-party payers who are interested in wheelchair seating and mobility assessment and applications. Seating and Wheeled Mobility provides a wide spectrum of information from foundational information for those practitioners who are new to the field to in-depth, population-specific information for practitioners who perhaps have not worked with a particular population in the past. Information sharing, opportunities for demonstration and trial, and patience on the part of the clinician working with the person with a disability are all critical precursors to the actual process of making equipment recommendations. Seating and Wheeled Mobility is divided into sections, each addressing a different area of clinical practice: - The first section is an in-depth presentation of the assessment process and the critical understanding of pressure management needed by the clinical team when working with a client population who rely on wheeled mobility. - The second section focuses on postural support. Also included is a completely updated method to measure and describe the seated person and related support surfaces needed when recommending a device. - The third section lays the foundation for clinical decision making around the assessment for and application of the most appropriate wheeled mobility device"-Provided by publisher.

Combining 25 years of clinical, research and teaching experience, Dr Lisa Harvey provides an innovative 5-step approach to the physiotherapy management of people with spinal cord injury. Based on the International Classification of Functioning, this approach emphasises the importance of setting goals which are purposeful and meaningful to the patient. These goals are related to performance of motor tasks analysed in terms of 6 key impairments. The assessment and treatment performance of each of these impairments for people with spinal cord injury is described in the following chapters: training motor tasks strength training contracture management pain management respiratory management cardiovascular fitness training Dr Harvey develops readers' problem-solving skills equipping them to manage all types of spinal cord injuries. Central to these skills is an understanding of how people with different patterns of paralysis perform motor tasks and the importance of different muscles for motor tasks such as: transfers and bed mobility of people wheelchair mobility hand function for people with tetraplegia standing and walking with lower limb paralysis This book is for students and junior physiotherapists with little or no experience in the area of spinal cord injury but with a general understanding of the principles of physiotherapy. It is also a useful tool for experienced clinicians, including those keen to explore the evidence base that supports different physiotherapy interventions.

Volume 2 of the Textbook of Neural Repair and Rehabilitation stands alone as a clinical handbook for neurorehabilitation.

In two freestanding volumes, Textbook of Neural Repair and Rehabilitation provides comprehensive coverage of the science and practice of neurological rehabilitation. Revised throughout, bringing the book fully up to date, this volume, Medical Neurorehabilitation, can stand alone as a clinical handbook for neurorehabilitation. It covers the practical applications of the basic science principles presented in Volume 1, provides authoritative guidelines on the management of disabling symptoms, and describes comprehensive rehabilitation approaches for the major categories of disabling neurological disorders. New chapters have been added covering genetics in neurorehabilitation, the rehabilitation team and the economics of neurological rehabilitation, and brain stimulation, along with numerous others. Emphasizing the integration of basic and clinical knowledge, this book and its companion are edited and written by leading international authorities. Together they are an essential resource for neuroscientists and provide a foundation of the work of clinical neurorehabilitation professionals.

Examines the theoretical and clinical aspects of physiotherapy provision for children and young adults including: neurology, cardio-respiratory musculoskeletal oncology and palliative care, mental health, and acquired brain injury. This title describes the changing needs of children with long term conditions.

Innovations in paediatric rehabilitation engineering can serve as a springboard to education, psychosocial, social, physical and cognitive development for children and youth with disabilities. Instead of providing an overview of rehabilitation engineering, Paediatric Rehabilitation Engineering focuses on the uniqueness of the paediatric subspecialty via an international sampling of methods and techniques currently in use or in development. The book is divided into three complementary components. The first group of chapters is broadly concerned with connecting individuals to their environment and to the people around them. The second group revolves around paediatric technologies that compensate for compromised or missing function. The final group of chapters is about machines and environments which provide stimulating and interactive platforms for therapy and research. Topics include: Microswitch-based occupational, recreational and rehabilitation programs Emerging access technologies, like infrared thermal imaging and vocal cord vibration detection Communication technologies to enable children to communicate in a variety of everyday environments Accessible graphical user and Web-based interface design Postural and upper and lower extremity compensation, such as customized chairs and prostheses Global efforts in the area of robotics for autism research Virtual reality and other interfaces to mitigate motor, communication, and physical control difficulties Paediatric rehabilitation engineering offers endless possibilities for future research with implications across the fields of physical and cognitive rehabilitation, medicine, computer science, and policy. It is the harmonizing of the expertise and energies of rehabilitation professionals such as teachers, families, paediatric rehabilitation engineers, and other stakeholders that will ensure that children are optimally supported as they embark on their journey from disability to possibility.

The discipline of rehabilitation engineering draws on a wide range of specialist knowledge, from the biomedical sciences to materials technology. Rehabilitation Engineering Applied to Mobility and Manipulation provides broad background and motivational material to ease readers' introduction to the subject. The book begins with a wide-ranging yet concise introduction to the legislative, technological, testing, and design basis of rehabilitation engineering, followed by the fundamentals of design and materials and a full account of the biomechanics of rehabilitation. Major sections of the book are devoted to various aspects of mobility, including detailed discussion of wheelchair design. Valuable additional material deals with seating, prosthetic devices, robotics, and the often-neglected subject of recreational devices and vehicles. More than a thousand references to the research and review literature put readers in touch with the leading edge of a rapidly growing field.
